

DEX DESIGN CREDITS SYSTEM

Developer Guide & Business Rule Book

(Authoritative Internal Document)

1. Purpose of This Document

This document defines the **Design Credits System** used by DEX to manage, control, and track design effort across interior projects.

It serves two purposes:

1. **Developer Product Requirements Document (PRD)** – to build the system correctly
2. **Business Rule Book** – to enforce non-negotiable operating rules

Any deviation from this document must be explicitly approved and logged.

2. Product Objectives

The Design Credits System exists to:

- Introduce a **structured and measurable** way to manage design effort
 - Prevent unlimited or uncontrolled design revisions
 - Maintain predictable timelines and execution discipline
 - Ensure fairness between client expectations and company effort
 - Provide transparency to internal teams and clients
 - **Enable scalable automation within CRM / product platforms**
-

3. Key Assumptions

The system is designed with the following assumptions:

- Every project must be **onboarded** before any design activity begins
 - Design credits are **project-specific** and **non-transferable**
 - All design milestones involve **formal meetings**
 - No design activity is permitted if available credits are zero
 - Payments and design credits are interdependent
 - Manual interventions are exceptions, not the norm
-

4. Credit Wallet System (Core Engine)

Each project has **one Design Credit Wallet**.

Credit Wallet Rules

- Initial credit balance: **1,000 credits**
- Credits are added automatically at project onboarding
- Wallet must track:
 - Total credited
 - Total consumed
 - Current balance
- Every credit action must be:
 - **Timestamped**
 - Linked to a user
 - Linked to an action (milestone, revision, override)

Controls

- Credit deductions are automatic based on system rules
 - Manual credit adjustments are:
 - Admin-only
 - Fully logged
 - Visible in audit reports
-

5. Design Milestones – Business Rules & Logic

Design is divided into **fixed milestones**.

Credits are deducted **only when a milestone is marked as “Completed.”**

Milestones & Credit Consumption

- Site Documentation – 150 credits
- Layout Finalisation – 200 credits
- Design Finalisation – 150 credits
- Validation / Production / Working Drawings – 150 credits
- Final Design Sign-off – 200 credits

Total milestone consumption: 850 credits

Milestone Rules

- A milestone cannot be completed without : Manager's approval
 - Only authorised roles may mark a milestone as completed
 - Re-opening a completed milestone:
 - Does NOT automatically refund credits
 - Requires admin intervention if reversal is needed
-

6. Buffer Credits (150 Credits)

After milestone completion:

- **150 credits remain** as buffer
- These credits exist to allow:
 - Minor refinements
 - Small adjustments
 - Final-stage flexibility

Buffer Rules

- Buffer credits can only be used after milestones
 - **Low-credit warnings must trigger at 50 credits remaining**
 - Buffer credits follow the same exhaustion rules as main credits
-

7. Revisions & Variations

Revisions (Charged Per Room)

Revisions apply **after design options are shared**.

- Layout change per room – 75 credits
- Design revision per room – 50 credits

Multiple rooms = cumulative credit deduction.

Variations (Not Revisions)

The following are **not** revisions are treated as **new additions**

- Changes in scope quantities
- Civil or structural work changes
- Material specification changes
- Structural layout changes

These require:

- Additional commercial approval, or
 - Credit top-up / revised payment
-

8. Credit Exhaustion & Top-Up Flow

When available credits reach **zero**:

- The design workflow is automatically paused
- Total paid amount (including booking) must reach:
10% of the final project value to proceed further

Resume Logic

- Once payment is confirmed:
 - Design workflow resumes
- If payment is not made:
 - Project remains frozen at the current stage

No design action is allowed without credits.

9. Roles & Permissions

Role Definitions

- **Client**
 - View credit balance
 - **Designer**
 - Consume credits through actions
 - Cannot override deductions
 - **Business Manager**
 - Approve milestone completion
 - Monitor credit usage
 - **Admin**
 - Override credits
 - Adjust balances
 - Reverse errors
 - All actions must be logged
-

10. Edge Cases & Failure Handling

The system must handle the following scenarios:

- Milestone marked complete accidentally
- Credit deduction failure during an action
- Multiple revisions requested in a single request
- Admin overrides applied incorrectly

Rules

- All failures must rollback safely
 - No silent adjustments allowed
 - Every exception must leave an audit trail
-

11. Acceptance Criteria (Build-Ready)

The system is considered complete only if:

- Credits are automatically added on onboarding
- Credits are deducted exactly per defined rules
- Design actions are blocked at zero credits
- All credit actions are logged and reportable
- Rule bypass is technically impossible without admin access

12. Reporting & Audit Requirements

The system must support:

- Credit ledger per project
- Milestone consumption reports
- Admin override logs
- Exportable formats (PDF / CSV)

13. Authority & Governance

This document is the **single source of truth** for:

- Design credit usage
- Revision governance
- Milestone control
- System enforcement

Any deviation from these rules must:

- Be explicitly approved
 - Be documented
 - Appear in audit logs
-
