

0:01
Hi team. So the first explanation is
0:04
about the credit system that uh we were
0:08
working on. How we have right now worked
0:10
on is over here. So I'll just tell my
0:13
assumption of how the credit system has
0:16
actually been been worked on at the
0:18
moment. Over here it is mentioned as
0:20
designed credits. The total uh first
0:22
thing is it is shown in rupees uh total
0:25
used and available. So if I go over here
0:28
to manage
0:30
and if I say add credits and let's say
0:35
if I'm adding 1,000
0:37
for initial
0:41
payment and I'm not adding the
0:42
reference.
0:45
So this is how it is getting added to.
0:49
And if I
0:52
create
0:54
the milestone
0:56
over here when we are creating the
0:58
milestone. So this milestone should be a
1:01
drop-down. I'll explain what these
1:04
drop-downs are. But this milestone
1:05
should be a drop-down. And if I select
1:07
let's say design, so these will be the
1:10
milestones. Uh site documentation,
1:12
layout finalization, design
1:14
finalization,
1:15
uh validation, final sign off. These are
1:18

the only milestones that must be
1:20
displayed as drop-down over here. And
1:23
when we display these these credits,
1:26
auto credit deduction is something let's
1:28
say when someone selects site
1:29
documentation automatically it should
1:32
reflect here as 150 and let's ignore
1:36
this.
1:38
So if we are going back over here
1:44
let's say
1:47
it is approved and total is 1,000 but
1:51
then used is still zero but we had
1:55
mentioned as 150 credits. Okay I am
1:58
submitting it for approval and I'm
2:00
approving it by myself because it is a
2:04
admin portal.
2:07
So if I go over here, okay, so total
2:10
used is 150, available is 850. This
2:12
looks perfect. But what we'll have to do
2:14
over here is I don't want it to be a
2:16
manual entry. These are the mandatory
2:19
milestone dropdowns and auto deductions
2:23
that should come. Let's say after this,
2:26
right? 850 credits are used. there is
2:28
150 that we have kept as a buffer
2:30
because the auto credit upon advanced
2:34
payment should be 1,000 credits that
2:37
that is to be allocated. Uh what I mean
2:40
by this is
2:43
let's say we are adding credits over
2:45
here right and this is an users page
2:47

prasad test is the client's name we are

2:50

adding credits again this this drop-down

2:53

should come first this should go second

2:56

and the first drop-down is project

2:59

initiation

3:00

and the stage is upon advanced payment

3:03

this is an internal thing the request

3:04

should go to admin and allocated credit

3:07

should be 1,000 so The project

3:09

initiation is the first uh drop-down

3:12

that should be there. And when someone

3:14

clicks project initiation, this credit

3:17

should be automatically filled as 1,000

3:19

credits and someone should request for

3:21

add credit. So it gets added like this

3:24

upon the admin's approval. So this is

3:27

one thing and the second thing is after

3:29

adding those,000 credits for each of

3:32

these stages auto deduction will happen

3:35

and overall 850 credits would have been

3:38

used and we have a buffer of 150 credits

3:41

at the moment. How these 150 credits

3:44

should be used after this is upon upon

3:47

using exhausting 850 credits. This is

3:50

how the drop-down should be. So you will

3:52

have to have a drop-down of all these

3:55

things plus these two things. So layout

3:58

change per room, design revision per

4:00

room. So let's say they are in the uh

4:05

design finalization milestone, right?

4:08

But they are not moving forward to the

4:10

validation. Over here the client is

[4:12](#)

asking for a layout change or a design

[4:15](#)

revision. What the designer will

[4:17](#)

actually do is select the drop-down as

[4:19](#)

design revision per room and add this 50

[4:23](#)

credits. So what naturally happens is

[4:26](#)

here instead of 850 because he has added

[4:30](#)

or he has done an additional change this

[4:33](#)

now is becoming 900 credits. So

[4:36](#)

automatically like this the,000 credits

[4:39](#)

can be utilized but if they are also

[4:41](#)

using lesser than this it's okay.

[4:45](#)

And what happens is upon exhaustion of

[4:49](#)

this complete 1,000 credits this follow

[4:53](#)

request type two is this is the type two

[4:56](#)

this is called as project topup over

[4:59](#)

here

[5:01](#)

when

[5:02](#)

let's say we are having add credits

[5:05](#)

option right as I told you the first

[5:08](#)

option is project initiation the second

[5:11](#)

option that we should have in this

[5:12](#)

description is project topup So this

[5:16](#)

project topup the designer will use upon

[5:18](#)

the uh exhaustion of this total,000

[5:21](#)

credits that is available. And what the

[5:24](#)

designer will do is they will request

[5:27](#)

for and this project topup automatically

[5:30](#)

should allocate 500 credits and not more

[5:33](#)

than this and they should enter um you

[5:37](#)

know let's say we have it as project top

[5:41](#)

up here. It should automatically get

5:44

reflected as 500 and they should be able

5:47

to add the credits.

5:55

Once the credits are added,

6:00

one second.

6:03

Okay. First let me Okay. Yeah. So

6:07

the,500 total credits are,500

6:11

out of this

6:13

let's say

6:16

we have exhausted all the

6:19

already we have exhausted 150 we have

6:21

exhausted the rest 850 as well.

6:29

So what happens is okay my first

6:32

question is why is the uh 500 credits

6:35

that we added extra did not come for

6:37

approval is it because it's an admin

6:40

portal or will it not come for approval

6:42

to anybody if it is not coming for

6:44

approval to anybody again this is

6:46

something that we'll have to rectify

6:48

because any credits that's required

6:50

extra apart from uh the first allocated

6:53

thousand credits first allocated

6:55

thousand credits also they'll ask for

6:56

approval approval and on top of it if

6:58

they need 500 more credits as well they

7:00

should be asking for approval and what

7:03

happens over here is now since the

7:07

designer has already used so,500 credits

7:11

has been allocated 1,000 is already used

7:14

only 500 is available they should they

7:17

will only be able to again select the

7:20

drop-downs from any of these uh things

7:23

only. So any of these um five drop-downs

7:28

or these two drop-downs

7:30

uh because let's say the designer is uh

7:34

coming up and until here and has

7:36

exhausted all the,000 credits and the

7:38

client was ready to make a payment top

7:41

up. So the client made that payment top

7:43

up. This becomes 1,500 credits for the

7:46

designer. The designer still will be

7:48

able to do only you know layout change

7:52

per room or design revision per room and

7:55

the uh uh the credit should get deducted

7:59

again as per so the same system should

8:02

follow this is how the credit system has

8:04

to work like and what I meant by credit

8:08

is this is the uh gamma platform where

8:12

this is how the credits are visible it's

8:14

not rupees because if it's mentioned as

8:17

rupees the client will again be getting

8:19

confused like are you charging me 1,000

8:21

rupees 500 rupees so that's not what we

8:24

want an actual credit system like how a

8:27

lot of these AI platforms have right now

8:30

this is exactly how we wanted it to look

8:32

like and yeah I think I've fairly

8:36

explained to how it has to work like

8:39

with all the drop downs and everything

8:42

uh yeah that's
