

0:00

So there are two more things which I

0:02

missed explaining on the old video. Um

0:05

one is about the credit system. The

0:07

about is the other is about the payment

0:09

terms. I'll first start with the credit

0:10

system. So for the credit system all

0:13

these things are the internal things

0:15

that we are doing the internal

0:17

activities. But then when I am exporting

0:19

a code to a client this credits are

0:22

nowhere about these credits are visible

0:25

right. Uh but if we could just act give

0:28

the client an access to this particular

0:31

thing uh total credits, credits used and

0:34

credits available.

0:36

So this should get autoc calculated

0:38

bases the uh overall credits as we

0:42

update over here. If the total uh

0:45

credits used is 850, this should become

0:47

850 automatically. every time we either

0:50

uh sh regenerate a link and share or uh

0:54

every time we export a PDF this should

0:56

get auto updated and the client should

0:59

be able to see this. So this thing we

1:01

can where we can have this is let's say

1:05

uh underneath this uh or even above over

1:09

here somewhere here or somewhere here

1:12

wherever it fits in the entire uh look

1:15

and feel of the code we can have this

1:17

one mentioned probably underneath this

1:19

quotation for Mr. Dharmandra we can have

1:22

a a box like this a text box like this

1:26

which mentions these three things as

1:28

total credits credits used available

1:30

credits so total credits can be by

1:32

default uh 1,000 and credits used can be

1:36

auto updated basis whenever they are

1:38

actually adding credits and for clients

1:40

whom the team has not at all requested

1:44

any credits this all these three should

1:46

uh remain zero. So this is the agenda

1:49

for the credit system and coming to the

1:52

payment terms. So again all these are

1:55

internal things that we are doing which

1:57

will get displayed over here like I had

2:00

requested right now above the terms and

2:02

conditions. It will be displayed here.

2:04

Beneath this we could have this for the

2:08

visibility of the client as project

2:10

wallet, wallet funded and wallet

2:12

balance. Project wallet is actually the

2:15

total final project value which is auto

2:18

captured by the system because the

2:20

system clearly knows what the uh total

2:23

final project value is. Let's say it is

2:25

11 lakh 67,350.

2:27

It will be auto captured by the system

2:30

and uh wallet funded is something that

2:33

the team will manually update. uh let's

2:36

say we are having this particular

2:37

project and we have this design credits

2:40

beneath this if we have another text box

2:44

and uh instead of design credits if we

2:46

have something if we have something

2:48

called as uh uh project wallet and if we

2:52

have an option called as manage over

2:54

here so the pro we it'll underneath this

2:58

it'll have three these three tabular

3:00

columns which is project wallet which is

3:02

automatically captured by the system

3:04

here as

3:05

and uh wallet funded alone the team will

3:09

uh capture it manually enter it basis

3:12

whatever the client has made a payment

3:14

of and then the third thing which is the

3:16

wallet balance is an auto capture which

3:19

is what uh project wallet minus the

3:22

wallet funded which will be autoc

3:23

calculated by the system. So if we could

3:26

have something like this over here

3:29

underneath the design credits regarding

3:32

the wallet, it'll be really helpful for

3:33

the client as well. And when the client

3:35

is viewing it, where we can have it for

3:38

the client is underneath this, we are

3:40

getting this payment terms as one text

3:42

box probably along with the payment

3:45

terms text box it box itself. We if we

3:48

could have this and for clients who has

3:50

not made a payment advance or anything

3:52

and if team has not updated anything

3:54

over here it can automatically be like

3:57

zero. So the project wallet is 12 lakhs,

3:59

wallet funded is zero and the wallet

4:01

balance remains the same 12 lakhs. So

4:05

please check and let me know how this is

4:07

going to work as well.
