

0:00
uh the next video is about the uh
0:03
payment terms that we'll have to follow.
0:06
So how I want the payment to terms to
0:09
display is like let's say
0:13
we are having this Dharmandras project
0:17
we have all the line items all the
0:19
costing over here underneath this when
0:23
we are exporting this as a PDF
0:27
this grand total is done right
0:30
underneath this payment details total
0:32
GST generated by interiors by DEX Before
0:36
terms and conditions, I want the payment
0:38
terms tabular column to be clearly
0:41
mentioned over here. And I'll explain
0:44
how the what the tabular column should
0:46
consist of. But this is how it has to be
0:48
there on when we are exporting the PDF
0:52
and when we are sharing again how it
0:56
should
0:58
or where it should get displayed is
1:01
underneath the entire code underneath
1:04
this grand total before the terms and
1:06
conditions we should have a clear tabula
1:09
column of the payment terms and how the
1:12
payment terms should act like is so
1:15
basically this system should auto
1:18
calculate three things for projects less
1:21
than or equal to uh 15 lakhs the
1:25
advanced pay okay it is mentioned over
1:27
here so basically for projects with a
1:30
total value of either 15 lakhs or below

1:34
15 lakhs the advance shall be 50,000 for
1:37
a project with a total value between 16
1:40
to 30 lakhs uh shall be 1 lakh for a
1:43
project with a total value exceeding 30
1:46
lakhs The advance shall be 1.5 lakhs.
1:49
And the system should actually auto
1:51
calculate this.
2:03
Yeah. So this is how it should be like
2:06
and the system should autocalculate. How it
2:08
should autocalculate is let's say
2:11
there is a project less than or equal to
2:13
15 lakhs. I have taken the use case of
2:16
12 lakhs over here and this is the
2:19
formula that we have mentioned. So less
2:21
than because it is 12 lakhs uh the
2:24
system auto calculated the token advance
2:27
amount as 50,000
2:29
and because it is 16 lakhs it auto
2:31
calculated as 1 lakh over here and
2:34
because it's 31 lakhs it is auto
2:36
calculated as 15 lakhs. Likewise, let's
2:39
say for this Dharmandra code since the
2:42
overall grand total value, this is the
2:45
exact value that I'm talking about
2:47
inclusive of GST, inclusive of all the
2:50
uh discounts every all the math done and
2:53
there's a final value that's appearing.
2:55
Right? If this value is less than or
2:57
equal to 15 lakhs, the token advance
3:00
amount should be considered as 50,000.
3:03
And if this value is above 16 under 30

3:07

lakhs it is 1 lakh and above 30 lakhs it

3:11

is 1.5 lakhs.

3:14

The second thing is okay so about this

3:17

token advance amount only this is

3:19

dynamic and it is done. What happens

3:22

next is uh the second payment. So how

3:25

the second payment is calculated is the

3:28

total values 60% minus the advance

3:31

amount paid. So that's the exact formula

3:34

the total value into 60% minus they have

3:38

already paid the advance amount the

3:40

agenda is about for this token advance

3:43

plus the second payment club together we

3:46

should have collected 60% of the entire

3:48

project's value from the client and then

3:52

the third payment is 40% upon material

3:55

delivery. So the total value because we

3:58

have already uh collected the entire 60%

4:02

over here only the 40% payment is left

4:06

the total value into 40% is what we

4:09

could actually collect from them. So

4:12

when when we add all these three line

4:15

items the actual total value is becoming

4:18

12 lakhs which is as per over here and

4:20

then the final balance is zero. So I

4:23

want uh these as a tabular column like

4:26

this payment schedule uh the payment

4:30

schedule is uh

4:34

token advance

4:36

and then upon design sign off it is 60%.

4:41

upon material delivery.

4:46
Sorry for this just a little bit of
4:47
changes
4:52
upon material delivery it is uh
4:57
40%. So what happens over here is all
5:01
these three put together 883 741 883 741
5:06
this is the total project value that has
5:08
been calculated. So this is uh one thing
5:11
that has to be added right beneath the
5:15
uh payment that is given over here and
5:17
it's it should be an autoc calculated
5:19
thing. It should not be a manual entry.
5:22
This is one thing and the second thing
5:24
is I had spoken about the discount uh
5:28
structure. Let's say for example what we
5:31
are at the moment doing is
5:33
we have an overall cost of each product
5:36
over here as 94,500
5:40
but this is not the actual cost because
5:43
the product has availed a 15% discount
5:46
and it'll be applicable to each and
5:49
every product that's available over here
5:51
only for the woodwork because the
5:53
discount over here is only on the
5:55
woodworks right so whatever comes under
5:58
the woodworks category will have all
6:00
these uh discounts applicable. Let's say
6:03
this Kari wallpaper will not have any
6:06
discounts applicable but this supply and
6:08
installation of premium quality charcoal
6:10
panel will have a discount applicable
6:12
and the actual cost is lesser than 15%

6:16
of this quoted 21,000. So I want the
6:19
system to again auto calculate this.
6:22
Let's say uh there is a woodwork line
6:24
item like this over here. We'll hide all
6:28
these things because at the end all
6:31
these will not be visible. I'm just
6:33
showing to exactly how it is visible
6:37
over here. So dimensions, quantity,
6:40
description is what is exactly visible.
6:43
So let's even
6:45
hide this rate. As of now what we have
6:47
is description, dimensions, unit I mean
6:51
all these comes under dimension and then
6:53
quantity and then the amount is visible.
6:56
I want one more column which says after
6:59
discount right and uh because uh we have
7:03
availed a 15% discount the actual amount
7:07
is getting reduced to 20,76
7:11
and all of these as well for that
7:13
matter. But when it comes to the floor
7:15
protection sheet over here, discount
7:18
should naturally get displayed as not
7:21
applicable because this is not a
7:22
woodwork line item. This is a line item
7:25
from the services. For example, over
7:27
here we have all these woodwork line
7:30
item. Uh the there should be another
7:32
column over here which uh displays
7:35
discounted amount and it should have all
7:37
the additions of the discounted amount
7:39
for the first four line items. But for

7:42

the fifth and the sixth it should become

7:44

not applicable because fifth is an

7:47

accessory line item and sixth is a um

7:51

services line item.

7:53

So this is how I want the system to

7:56

calculate for the all of these things

7:58

over here. The discount column uh

8:01

costing will be applicable here here

8:04

here

8:05

but it will not be applicable for the

8:07

accessory that is mentioned here. And

8:10

this is also an accessory. So it will

8:11

come as not applicable as it is

8:14

mentioned over here. So all these are

8:18

woodwork line item and then all these

8:21

are civil services or wall I mean uh

8:24

accessory line item for which the

8:26

discount is naturally becoming not

8:28

applicable. So I hope I'm clear with

8:32

both of these payment terms and then

8:35

this discount details.
